

CRC Cards for Ms. Pacman

Group: Breakfast

<div>GameObject</div> <div><div>Interface that describes the common essential behaviors of all characters in the game. This includes draw() and update()</div><div>MovingObject StationaryObject</div></div>	<div>StationaryObject</div> <div><div>The parent class for all game object which can not move.</div><div>NormalPellet PowerPellet</div></div>	<div>ArcadeList</div> <div><div>A list of Arcade objects. In a pacman game lifecycle, there may be more than one arcade used. This list manages to control and update each individual Arcade.</div><div>Arcade</div></div>	<div>Arcade</div> <div><div>Hold 1 Arcade object that describes the layout of the map. The Arcade object provides a coordination system and constraints so that the game objects such as the pacman, pellets, and cherries can be hold upon.</div><div>ArcadeBlock</div></div>	<div>ArcadeBlock</div> <div><div>The ArcadeBlock is most fundamental building block to an Arcade. The ArcadeBlocks are of the same shape but with different coordinates and properties.</div><div>N/A</div></div>
<div>MovingObject</div> <div><div>The parent class for all game object which can not move.</div><div>NormalPellet PowerPellet</div></div>	<div>Pacman</div> <div><div>Save all 4 Pacman faces/directions into an array and be able to return the correct face with animation based on the direction argument passed be the caller object. Eat Pellets.</div><div>Ghost PelletCell PowerPelletCell BitmapDivider</div></div>	<div>GhostList</div> <div><div>It stores and renders all 4 ghosts.</div><div>Arcade Ghost BitmapDivider</div></div>	<div>Ghost</div> <div><div>randomized Ghost's movement without user input. Try to kill Pacman by Collision</div><div>Pacman CollisionDetector</div></div>	
<div>PacmanActivity</div> <div><div>initialize the game and set up all screen configuration (fill screen, and maybe landscape mode). Handle pause and resume situations.</div><div>PacmanGame</div></div>	<div>PacmanGame</div> <div><div>initialize the all images, such as the Pacman, ghosts, obstacles, ect. Run the game until all 3 lives of the pacman have been consumed. be able to move the Pacman. Be able to detect collision.</div><div>Pacman Ghost ScoreSystem PlayerInput GhostControl</div></div>	<div>GameObjectCollection</div> <div><div>The place to collect and update all GameObjects related to one Arcade</div><div>Arcade</div></div>	<div>PlayerInput</div> <div><div>Be able to register the user input through swipes (up, down, left, and right) and return the command back to the caller object (PacmanGame)</div><div>N/A</div></div>	
<div>PelletList</div> <div><div>Has the collection of pellets, i.e. pelletCell, powerpelletCell. Initialize the location of each cell, and their points. Visibility states.</div><div>PelletCell PowerPelletCell ArcadeList PacmanGame TwoTuple</div></div>	<div>PelletCell</div> <div><div>Each cell has type of pellets. State: uneaten/visible, eaten/unvisible. Initializes with points, if gets eaten then decrement the points</div><div>GameObject</div></div>	<div>PowerPelletCell</div> <div><div>Inherits the pelletcell, but has different points, look and locations.</div><div>PelletCell</div></div>	<div>Cake</div> <div><div>Independent class for displaying the Cake onto the screen. Set a timer for the when to be displayed and for how long.</div><div>MotionInArcade TwoTuple Arcade</div></div>	<div>ScoreSystem</div> <div><div>Seperate class for keeping the scores of the pacman game, will be initialized in Pacman Game. Keep tract of the scores that the pacman is gaining. Based on the different pellets that pacman eats, score different score will be added. Also have a boolean value for cherry, if cherry is eaten, everything gets eaten after will counts double of its original points.</div><div>pacmanGame Pellets PowerPelletCell Cake</div></div>
<div>UserInput</div> <div><div>This objects works as a listener to the touch events on the screen. It extract essential information from each touch event and keep the information so that functions in other threads can use it.</div><div>listener (Java util)</div></div>	<div>JsonParser (ArcadeDecoder)</div> <div><div>The Arcade information is kept in a JSON file. This object reads the file and calls the construtor of ArcadeList</div><div>JsonReader (Android IO)</div></div>	<div>BitmapDivider</div> <div><div>Divide one bitmap into multiple based on row and column</div><div>N/A</div></div>	<div>WelcomeView</div> <div><div>This is the first class that gets displayed onto the player's display, and allows the player to choose the game mode (easy, normal, and hard)</div><div>N/A</div></div>	
<div>CollisionDetector</div> <div><div>This object takes 2 Obstacle objects and determine if they have collided into each other.</div><div>Obstacle</div></div>	<div>Obstacle</div> <div><div>This object takes a game object and transorm it into a obstacle. Every GameObject can be considered as an Obstacle. This class will assist collision detection. The reason we want this class is to calculate the dimension of the bounding box of a moving or stationary GameObject.</div><div>N/A</div></div>	<div>GameMode</div> <div><div>It changes the speed of the entire game based on the player initial input at WelcomeView page. Options are: easy (slow), normal (faster), and hard (fast).</div><div>WelcomeView</div></div>	<div>NextMotionInfo</div> <div><div>Use this class to return updated motion information, if the motion information is not valid, the gameObject recive this motion info can not change its motion status.</div><div>TwoTuple</div></div>	
<div>MotionInArcade</div> <div><div>Detect the motion in arcade is valid or not. Project current motion onto the arcade block. Current motion is not only decided by current position but also current direction.</div><div>TwoTuple Arcade</div></div>	<div>NavigationButtons</div> <div><div>This is the pacman control which based on the input of player's touch on the button to control the pacman</div><div>N/A</div></div>	<div>UserInput</div> <div><div>we take user input and process all other stuff based on this object.</div><div>N/A</div></div>		
<div>TwoTuple</div> <div><div>contains the X and Y coordinate.</div><div>N/A</div></div>	<div>ConsoleReader</div> <div><div>This is an utility class that reads console input (keyboard input). The reason we do this is to use keyboard to control Pacman.</div><div>N/A</div></div>			
<div>GhostBehavior</div> <div><div>We have 4 ghost in the game, and each of the ghost acting differently. (i.e. the red ghost will trace the pacman.)</div><div>Ghost</div></div>	<div>ChaseBehavior</div> <div><div>target directly on the pacman</div><div></div></div>	<div>ChaseFrontBehavior</div> <div><div>target a distance infront of the pacman</div><div></div></div>	<div>EscapeBehavior</div> <div><div>escape from the pacman</div><div></div></div>	<div>KilledBehaviour</div> <div><div>go back to the reborn point</div><div></div></div>
<div>PredictAndChaseBehaviour</div> <div><div>target on the extension line from the red ghost to the pacman</div><div></div></div>				
<div>MotionInfo</div> <div><div>describes the current motion status</div><div>TwoTuple</div></div>	<div>StaticInfo</div> <div><div>describes the current location status</div><div>TwoTuple</div></div>			
<div>Records</div> <div><div>Modify local JSON to keep the highest records</div><div>Record</div></div>	<div>Record</div> <div><div>A record that keeps User name in string and score in int</div><div></div></div>			

Description

CRC (class, responsibilities, and collaboration) cards are a visual brainstorming technique often used in the early stages of system development. Used in Extreme Programming, this brainstorming method can help you understand the different objects that your team will be creating and how these will interact with other people, places, things, or functions. CRC cards quickly help to uncover potential problems or weaknesses in the system.

To use this template, fill in the cards by first putting the class name in the header. A class represents a collection of similar objects (an object being defined as any person, place, thing, event, etc. relevant to the system). Next, list that class's responsibilities (i.e. anything that class knows or does) in the left-hand column. List collaborators (other classes) this class needs to complete its responsibilities (because it either doesn't know or can't do it itself) in the right-hand column.

Move the cards around and place those that are closely related next to each other. You can also add color to further clarify close relationships.
